

Reference Reprojection Settings

Problem: You just upgraded from Bentley Map V8i (SELECTseries) to the Bentley Map CONNECT Edition and none of your attached Reference Files seem to be reprojecting in the proper location.

Resolution: The Reprojection Settings may have been reset to a default condition. Review the Reference Reprojection Settings to see that any previously modified settings still match the needs of your project.

1. Open the Reprojection... menu item that is within the References dialog
2. Review and modify any settings that had been previously modified in the V8i installation

3. If you don't have knowledge of the preexisting settings, a good rule-of-thumb is to set all options to Yes.
4. Save the settings, close the dialog boxes and review the positional accuracy of the References to see that they fall within your prescribed tolerances.
